

Finding a 4 year home

Every year college students drop out or transfer because they are unhappy living in the area that the school they choose is in. May be it is to rural and there is not enough to do or maybe it is too busy and they are overwhelmed by everything.

- The goal of this project is to match a student to a school that has similar venue options as the city they live in.
 - For this project I used Waukesha Wisconsin as the city the student lives in and all the 4-year schools in the state of Wisconsin as the choices for Universities.
 - I picked the University of Milwaukee Waukesha as the central location for Waukesha and the address of all the 4-year schools as the center for their respective locations.
 - I also decided that 3200 meters is a good distance for a student to travel without a car. This is the distance around each school I will use for the project.
- 

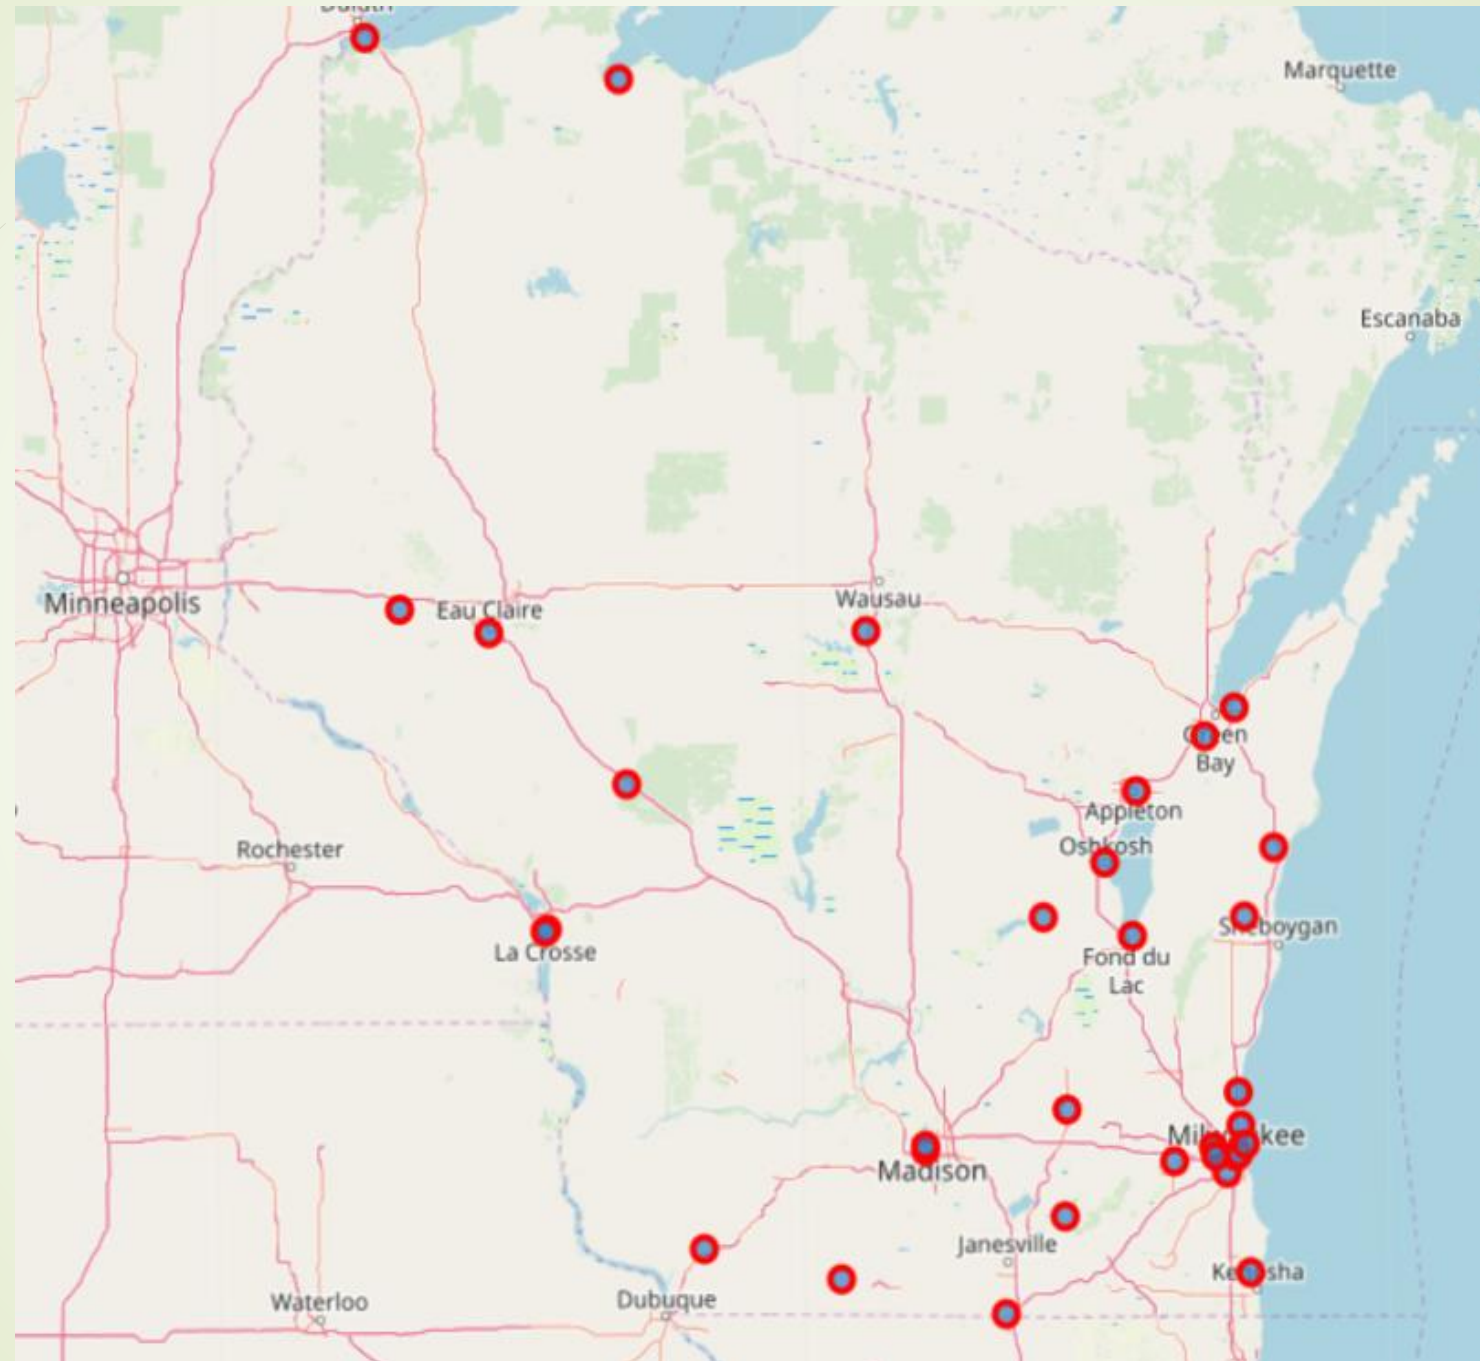

Using the following site I created a list of all universities in the state of Wisconsin.

- https://en.wikipedia.org/wiki/List_of_colleges_and_universities_in_Wisconsin
- Because I have a limited number of calls I can make from FourSquare I choose to only include 4-year institutions.

After creating the list I used google to find all the longitude and latitudes of the schools using there addresses. The following table is the first few rows of the CSV file.

| School | Address | City | Type | Latitude | Longitude |
|-----------------------------|---------------------|-----------|------------------------------|----------|-----------|
| Alverno College | 3400 S 43rd st | Milwaukee | Master's university | 42.983 | -87.967 |
| Beloit College | 700 College St | Beloit | Baccalaureate college | 42.503 | -89.031 |
| Cardinal Stritch University | 6801 N Yates Rd | Milwaukee | Doctoral/research university | 43.142 | -87.906 |
| Carroll University | 100 N East Ave | Waukesha | Master's university | 43.024 | -88.221 |
| Carthage College | 2001 Alford Pard Dr | Kenosha | Baccalaureate college | 42.622 | -89.822 |

Here is a map of all the schools we are using in the project

Making the call to Foursquare and K-means clustering

Using Foursquare we can generate a list of all venues with-in 3200 meters of each school and 3200 meters of Waukesha.

Once we have the list we can use k-means clustering to see which schools are similar to Waukesha.

I did two runs of the test

- ▶ Run 1 I used all venues to do clustering
- ▶ Run 2 I used the following list to run clustering on a limited number of venues types.

Sports Bar, Coffee Shop, Diner, Gym, Gym / Fitness Center, Mexican Restaurant, Pizza Place, Bank, Golf Course, and Basketball Court.

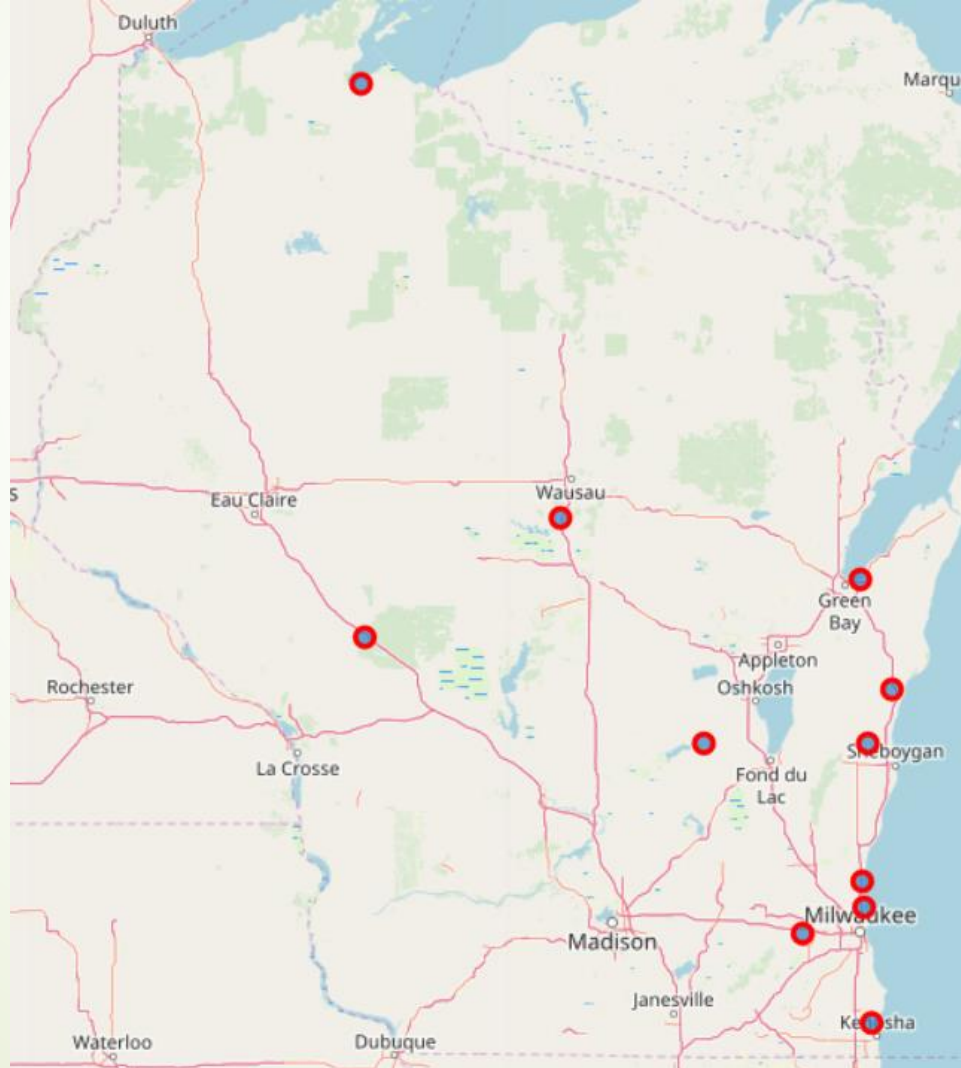

Run 1 All Venue Categories

Running k-means clustering with all venue categories clustered Waukesha with the following schools.

- Cardinal Stritch University
- Concordia University
- Lakeland University
- Northland College
- Ripon College
- Silver Lake College
- University of Wisconsin-Green Bay
- University of Wisconsin-Parkside
- University of Wisconsin-River Falls
- University of Wisconsin- Stevens Point

Here is a map of the schools that share a cluster with Waukesha

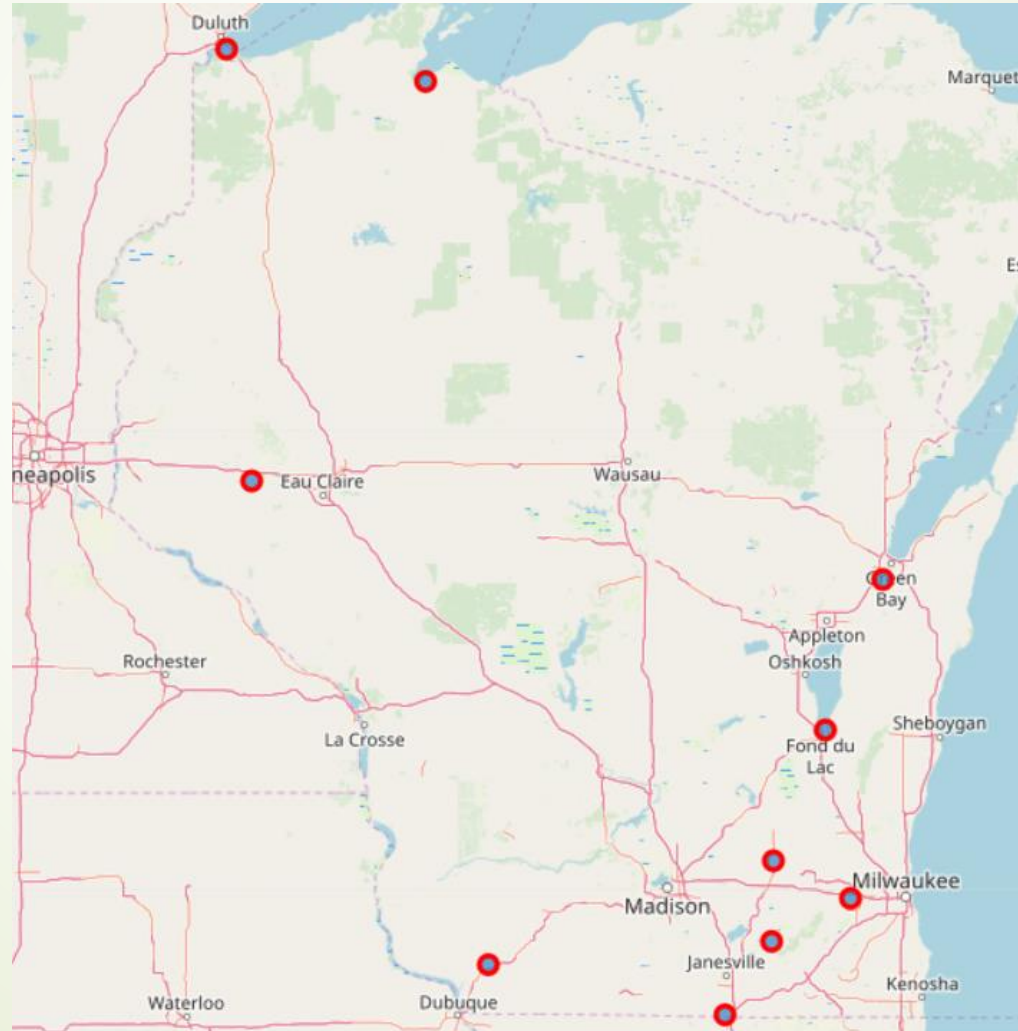

Run 2 Clustering using limited Venue Categories

Running k-means clustering with a limited set of venue categories clustered Waukesha with the following schools.

- ▀ Beloit College
- ▀ Maranatha Baptist University
- ▀ Marian University
- ▀ Northland College
- ▀ St. Norbert College
- ▀ University of Wisconsin-Platteville
- ▀ University of Wisconsin-Stout
- ▀ University of Wisconsin-Superior
- ▀ University of Wisconsin-Whitewater

Here is a map of Schools cluster with Waukesha when the venue categories are limited

Comparing the two list of schools

We can see that the list do not share any schools in common

Schools when cluster with all Venues

- Cardinal Stritch University
- Concordia University
- Lakeland University
- Northland College
- Ripon College
- Silver Lake College
- University of Wisconsin-Green Bay
- University of Wisconsin-Parkside
- University of Wisconsin-River Falls
- University of Wisconsin- Stevens Point

Schools when clustered with limited venues

- Beloit College
- Maranatha Baptist University
- Marian University
- Northland College
- St. Norbert College
- University of Wisconsin-Platteville
- University of Wisconsin-Stout
- University of Wisconsin-Superior
- University of Wisconsin-Whitewater

Which method gives a better result?

Lets look at some of the venues and compare how similar they are to Waukesha.

We will look pizza places

Ideally we should probably compare all of the graphs.

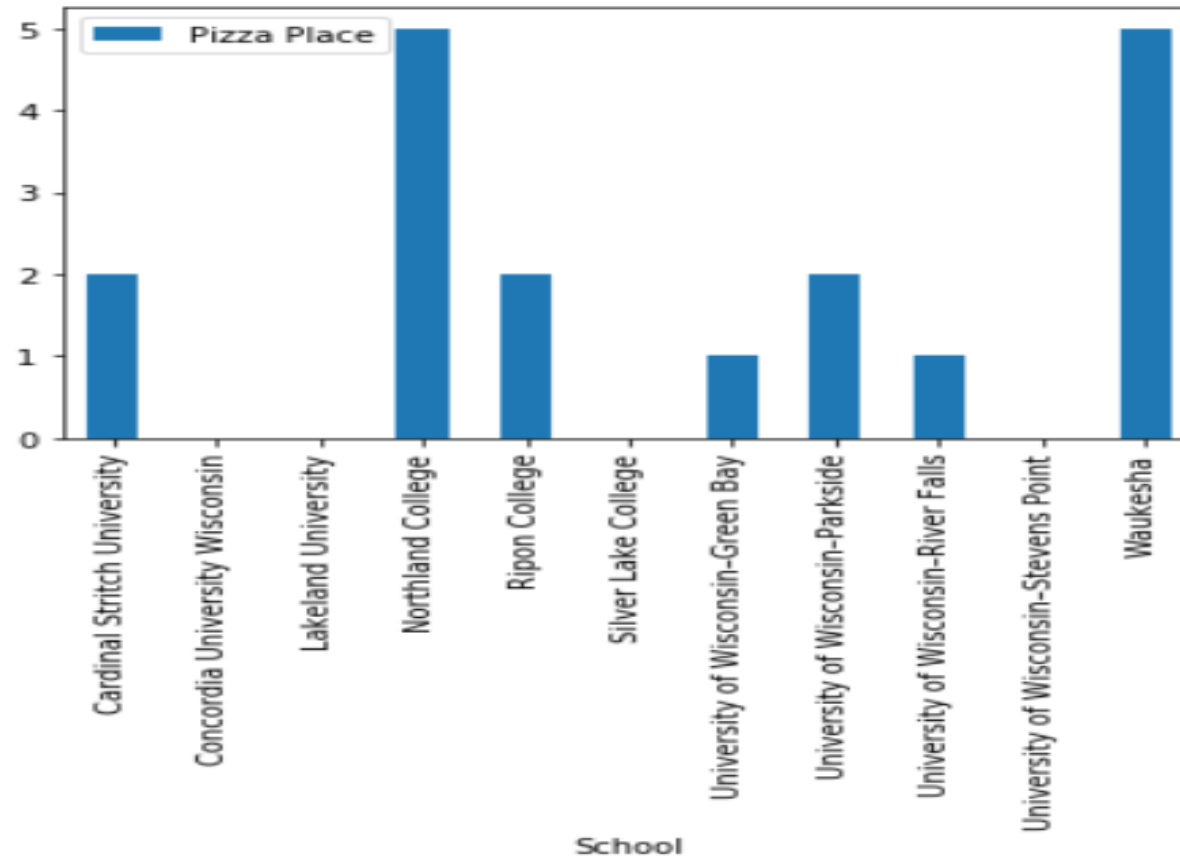

Bar Graph Pizza Places when the categories are limited

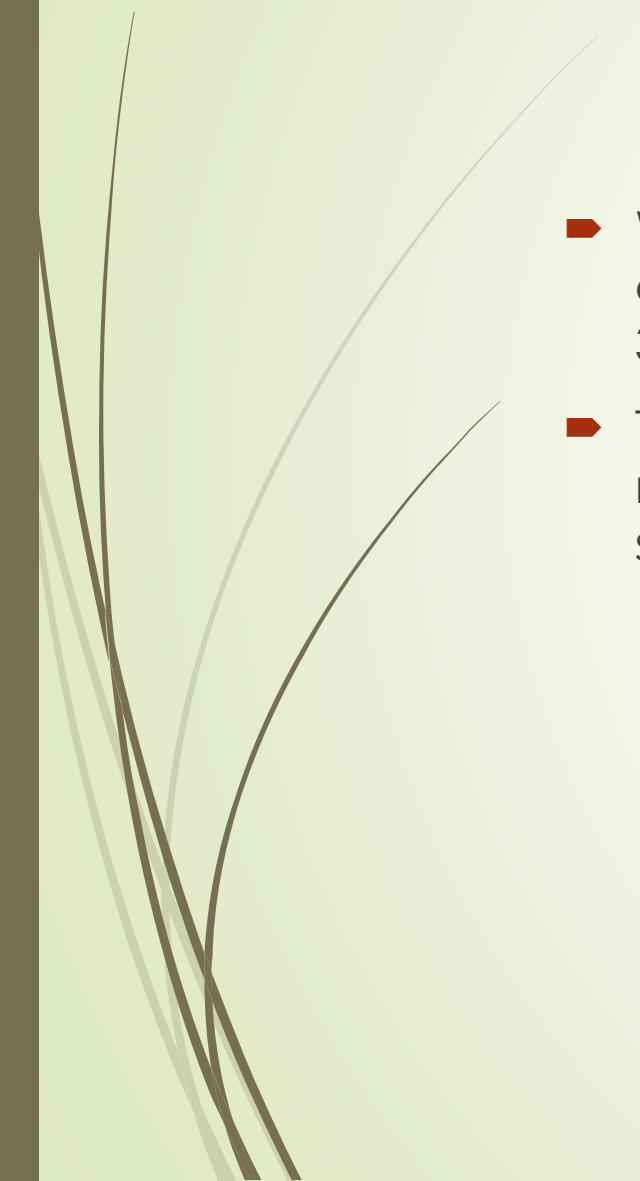

```
pizza = wi_test_limit.plot.bar(x='School', y='Pizza Place', rot=90)
```

Bar Graph when categories are not limited.

```
pizza2 = wi_test.plot.bar(x='School', y='Pizza Place', rot=90)
```

- 
- 
- We can see that the clustering method that did not limit the categories clustered Waukesha with schools that do not have any pizza places with-in 3200 meters. This would be a problem if you really like pizza.
 - The clustering method that used limited categories seems to be a better match then the other method. There are at least 3 pizza places near each school which is close to the number at Waukesha.

Information that can be returned to Client

- Now that we have located some schools with similar area to Waukesha we can give the client information on the venues located around each school.
- In the following slides I will show examples of the following.
 - Top of the list for all venues around Beloit College
 - List of all Pizza Places around Beloit College
 - List of all venues from the limited list of venues used for both Beloit College and Maranatha Baptist Bible College
- Ideally these list would be populated for all the schools and given to the client to help them make a decision on where to live.

Top of list for all venues around Beloit College

| School | School Latitude | School Longitude | Venue | Venue Latitude | Venue Longitude |
|----------------|-----------------|------------------|--|----------------|-----------------|
| Beloit College | 42.503 | -89.031 | Merrill & Houston's Steak Joint | 42.501016 | -89.031016 |

| 615 | Maranatha Baptist University | 43.194 | -88.739 | |

Conclusion

The method which limits the venue categories seems to work better than the method that uses all categories. Most people would want to be matched on venues they visit so if they could choose the category it would give them better results.

Going forward

I should try other clustering methods but k-means is the only one I have had time to practice.

I also limited the number of venues and the distance from each venue so I did not use up all my calls to foursquare. If I paid for an account I would increase both these numbers.

It would also be nice if people could rank things they enjoy instead of matching them to a location but that programming skill is beyond my current skill level.
